

Each water purification project is unique. Verification and optimization should be performed on-site before a purchase decision is made. Purifics facilitates and expedites on-site pilot testing using our complete Packaged Pilot Systems (PPS). The onsite test program consists of a series of test runs at various operating parameters to determine optimal treatment rates and cost structure. During this testing, influent and effluent samples are drawn for analysis. Pilot tests are typically as short as one week in duration or up to several months, as determined by the client / regulator.

The packaged pilot systems are fully automated and typically housed in a self-contained enclosure. They are operated by a touch-screen SCADA system that is equipped with remote control capability. They are easily delivered on-site and operational within an hour. The mobile systems are identical to full-scale systems. Consequently, full scale system design is simply a linear scale-up of capacity based on the test data.

On-Site Verification Proposal & Pilot Protocol

An on-site verification proposal is available upon request for your specific requirement.

Prior to testing, a pilot protocol is co-developed by Purifics and the client. The goal of the protocol is to verify treatment to the client's specifications, verify O&M cost estimates, and to obtain the required engineering data for the design & regulatory approval of a full-scale water purification system.

Verification Testing & Optimization

In the initial phase of the test program, treatment is performed to the client's specifications. Once effluent compliance is verified, optimization tests are performed to reduce O&M costs and equipment size. This is accomplished by varying flow rate, system power and other proprietary techniques. After optimization is complete, sustained purification is performed as per the pilot protocol.

Laboratory Analysis

Laboratory testing is the responsibility of the client. The client must select and approve the lab used in the program.

Test Report & Full Scale System Recommendation

At the conclusion of the onsite pilot verification a final test report, consisting of the objectives, description, results, discussion, conclusions, system recommendations, and an appendix of the test data is submitted to the client. A full scale treatment train recommendation will be made. This will include capital, operating and maintenance costs, as well as other system parameters.

Mobilization & Demobilization

The mobile system will be prepared for transport to the client's site upon receipt of a purchase order. The delivery date can be set as early as one week after receipt of the PO. The delivery time, method and other logistics will be coordinated with the client. Logistics, such as the test location, site security and access, client procedures and regulations and power requirements, are also discussed at this time.

The mobile system will be demobilized and returned to Purifics upon conclusion of the testing. Disposal of the treated water is the responsibility of the client.
